

Boin Gold Zone RC Drill Summary

Gold bearing mineralization at Boin occurs as late fine grained to medium grained auriferous pyrite cubes, stringers, and blebs within quartz-carbonate (ankerite) veins or as disseminated sulphides within the altered and sheared volcaniclastics or phyllites. The 112 completed RC drill holes returned a total of 80 gold intercepts greater than 1.0 g/t Au as shown in Table 9.1.
